

# Sun Storage Automated Diagnostic Environment Enterprise Edition Release Notes

Version 2.4.12.007

---

Sun Microsystems, Inc.  
[www.sun.com](http://www.sun.com)

Part No. 819-0432-10  
November 2004, Revision A

Submit comments about this document at: <http://www.sun.com/hwdocs/feedback>

Copyright 2004 Sun Microsystems, Inc., 4150 Network Circle, Santa Clara, California 95054, U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more of the U.S. patents listed at <http://www.sun.com/patents> and one or more additional patents or pending patent applications in the U.S. and in other countries.

This document and the product to which it pertains are distributed under licenses restricting their use, copying, distribution, and decompilation. No part of the product or of this document may be reproduced in any form by any means without prior written authorization of Sun and its licensors, if any.

Third-party software, including font technology, is copyrighted and licensed from Sun suppliers.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and in other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, AnswerBook2, docs.sun.com, Solaris, Solstice DiskSuite, Sun Cluster, and Sun StorEdge are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and in other countries.

All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and in other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc. Legato, the Legato logo, and Legato NetWorker are registered trademarks of Legato Systems, Inc.

The OPEN LOOK and Sun™ Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

U.S. Government Rights—Commercial use. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Sun Microsystems, Inc. a les droits de propriété intellectuels relatants à la technologie qui est décrit dans ce document. En particulier, et sans la limitation, ces droits de propriété intellectuels peuvent inclure un ou plus des brevets américains énumérés à <http://www.sun.com/patents> et un ou les brevets plus supplémentaires ou les applications de brevet en attente dans les Etats-Unis et dans les autres pays.

Ce produit ou document est protégé par un copyright et distribué avec des licences qui en restreignent l'utilisation, la copie, la distribution, et la décompilation. Aucune partie de ce produit ou document ne peut être reproduite sous aucune forme, par quelque moyen que ce soit, sans l'autorisation préalable et écrite de Sun et de ses bailleurs de licence, s'il y en a.

Le logiciel détenu par des tiers, et qui comprend la technologie relative aux polices de caractères, est protégé par un copyright et licencié par des fournisseurs de Sun.

Des parties de ce produit pourront être dérivées des systèmes Berkeley BSD licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays et licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, AnswerBook2, docs.sun.com, Solaris, Solstice DiskSuite, Sun Cluster, et Sun StorEdge sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays.

Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc. Legato, le logo Legato, et Legato NetWorker sont des marques déposées de Legato Systems, Inc.

L'interface d'utilisation graphique OPEN LOOK et Sun™ a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciées de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui en outre se conforment aux licences écrites de Sun.

LA DOCUMENTATION EST FOURNIE "EN L'ÉTAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFAÇON.

# Storage Automated Diagnostic Environment Enterprise Edition Release Notes

---

This document contains important information about the Sun Storage Automated Diagnostic Environment Enterprise Edition that was not available at the time the product documentation was published. Read this document so that you are aware of issues or requirements that can impact the installation and operation of the Storage Automated Diagnostic Environment Enterprise Edition.

The Release Notes consists of the following sections:

- v "About This Release Note" on page 2
- v "Features in This Release" on page 2
- v "System Requirements" on page 6
- v "Installing the Software" on page 9
- v "Getting Started" on page 16
- v "Device and Product Use Information" on page 31
- v "Known Issues" on page 36
- v "Resolved Issues" on page 40
- v "Release Documentation" on page 45
- v "Service Contact Information" on page 48

---

## About This Release Note

The information in this release note applies to the Storage Automated Diagnostic Environment Enterprise Edition when it is obtained as a standalone product from the Sun web site or from a CD.

Refer to the release notes for the device or system with which you obtained the Storage Automated Diagnostic Environment Enterprise Edition for additional information on this product.

---

**Note** – Command Line Instruction (CLI) procedures in this release note apply to the Storage Automated Diagnostic Environment Enterprise Edition it is obtained as a standalone product only.

---

---

## Features in This Release

The Storage Automated Diagnostic Environment Enterprise Edition product is used for the fault management of Sun storage devices. It provides full-time device monitoring, local and remote notification, diagnostics, revision analysis, reports, and integration with appropriate device management software.

The Agents supplied by the Enterprise Edition can be used to collect data and analyze the condition of Sun StorEdge devices. The Diagnostics can be used to verify the condition of a system, identify failing FRUs, and verify FRU replacement.

The Storage Automated Diagnostic Environment Enterprise Edition is for use by system administrators and support personnel who are familiar with Sun's disk array and SAN products.

## Product Components

---

**Note** – If you obtained Storage Automated Diagnostic Environment Enterprise Edition bundled with a device-specific or system specific software package, this section does not apply to you. Refer to the device-specific or system-specific release notes and documentation for product component information.

---

The Storage Automated Diagnostic Environment Enterprise Edition consists of two components:

- v SUNWstade

The SUNWstade is the base product package containing all product functions except the web browser-based management station. The base package contains a command line interface (CLI) for product configuration and use.

- v SUNWstadm

The optional SUNWstadm package adds a web browser-based graphical user interface (GUI) to the Storage Automated Diagnostic Environment Enterprise Edition. Additional management station packages are available to produce localization versions of the management station.

Each product component is installed and configured separately.

## Main Features

The following are the main features of the base component (SUNWstade) of the Storage Automated Diagnostic Environment Enterprise Edition:

- v Collects and reports information about Sun StorEdge devices. Type of information reported includes device configuration, device statistics, device state and availability, device message-log information, and system configuration.

Refer to the following file for a listing of all possible generated events:

`/opt/SUNWstade/System/EGrid/EventGrid2.pdf.`

- v Service Advisor guides the user through FRU replacement procedures for the Sun StorEdge 6130 Array.
- v Contains revision checking functionality of Fiber Channel devices.
- v The Sun SAM-QFS Storage Archive Manager and Quick File System application version 4.1 provides SNMP traps that can be consumed by the Storage Automated Diagnostic Environment Enterprise Edition. This feature allows the user to configure the Storage Automated Diagnostic Environment Enterprise Edition so that it posts alarms and alerts the user when these SAM-QFS traps occur. The traps themselves are generated from one of three sources. They are either about errors occurring with the SAM-QFS application itself, tape alerts from tape drives, or tape alerts from tape libraries. See the “Product Hints” section listed below for special instructions on configuring the Storage Automated Diagnostic Environment Enterprise Edition and SAM-QFS for this feature.
- v The Sun SAM-QFS Storage Archive Manager and Quick File System application version 4.2 provides a Fault Management API which increases the level of fault coverage for Storage Automated Diagnostic Environment Enterprise Edition. In order to experience this additional coverage Storage Automated Diagnostic Environment Enterprise Edition (Master or Slave) must be installed on the same

host as the SAM-QFS 4.2 to be monitored. The additional features are realized only when SAM-QFS 4.2 is monitored by Storage Automated Diagnostic Environment Enterprise Edition. These features are as follows:

- v Instrumentation Agent

Queries the SAM-QFS 4.2 Fault Management API for Asset and Health attributes of the hardware devices (tape drives and libraries) included in the SAM-QFS configuration. Examples of device asset attributes are those which remain static such as device product name, vendor and serial number. Examples of device health attributes are “state” (on, idle, off or down) and “attention” (user intervention required). When a health attribute changes to a bad state, Storage Automated Diagnostic Environment Enterprise Edition issues an alarm which provides a detailed description and identifies the device in question.

- v Revision Checking

Storage Automated Diagnostic Environment Enterprise Edition uses the SAM-QFS 4.2 Fault Management API in order to retrieve the current firmware revisions of 4 Sun branded tape libraries and 11 Sun branded tape drives qualified to operate with SAM-QFS. A revision report indicates whether the firmware revisions of the installed devices are up to date with what Sun has currently released.

- v Log Parsing

Storage Automated Diagnostic Environment Enterprise Edition reads the sam-log every 5 minutes, processing only those entries made since the last polling cycle. If Storage Automated Diagnostic Environment Enterprise Edition finds sam-log entries that are of severity “warning” or higher, it posts alarms whose description contains the hardware device or process name and a description contained in the log entry. Note that in order for this feature to be effective, the SAM-QFS sam-log must be enabled by entries in the `/etc/opt/SUNWsamfs/defaults.conf` and `/etc/syslog.conf` files. See the SAM-QFS documentation for details.

- v The Management Station component of the Storage Automated Diagnostic Environment Enterprise Edition (SUNWstadm) incorporates a graphical user view of fibre channel (FC) storage devices and their interconnections.

# Changes And Enhancements

This section lists the changes and enhancements in the this release and the last release of the product

## Version 2.4

- v Separated product into base package with CLI (SUNWstade) and optional GUI package (SUNWstadm).
- v
- v New user interface for the management station
- v Simplified Device Discovery
- v Support for the Sun StorEdge 6130 storage Array
- v SAN 4.X Support
- v Bug fixes

## Version 2.3

- v Support for the Sun StorEdge SE 5210 NAS and Sun StorEdge SE 5210 EU
- v Support for the Sun StorEdge 3511 serial ATA storage Array
- v Support for the Sun StorEdge 3310 and 3120 SCSI JBOD Arrays
- v SAM-QFS 4.2 SNMP traps, Asset/Health Instrumentation Log Parsing and Device Firmware Revision Checking.
- v SAM-QFS 4.1 SNMP trap feature
- v Support StorEdge 3510 FC array firmware 3.27r and sccli 1.5
- v Support StorEdge 3310 SCSI RAID array 3.25s and sccli 1.5
- v SAN 4.3
- v Support Inrange FC9000 Switches
- v Support for JNI Host Bus Adapters
- v Support for HDS
- v Support for 6140 McData FC Switch
- v Periodic vol verify scheduling
- v Updated revision matrix
- v New Event Severity Mapping
- v Bug fixes

---

# System Requirements

This section describes the requirements for the Storage Automated Diagnostic Environment Enterprise Edition.

You can use the Sun Storage Automated Diagnostic Environment Enterprise Edition on the following platforms and operating systems:

## Qualified Platforms

The following platforms are qualified for the Storage Automated Diagnostic Environment Enterprise Edition.

### Sun Platforms

- v All Sun Sparc Solaris servers

### Operating Systems

- v Solaris 9
- v Solaris 8 4/01 or greater:

Reference the *Best Practices for Deploying Storage the Sun Storage Automated Diagnostic Environment Utility* (817-5205-10) at <http://www.sun.com/blueprints>

- v Perl:

5.005 through 5.8.3 is mandatory. Use the following URL to download the proper version if necessary <http://www.perl.com/pub/language/info/software.html>  
If a supported version already exists on your system, create a symbolic link of the executable to `/usr/bin/perl`.

### Browsers

- v Netscape 7.x
- v Mozilla 1.4 or greater
- v Internet Explorer 5.x
- v Internet Explorer 6.x

# SUNWstade Requirements

This section identifies the SUNWstade requirements of the product.

- v The SUNWstade package will be installed at `/opt/SUNWstade/` and logfiles and device information will be located in `/var/opt/SUNWstade`.
- v The SUNWstade package requires 90 MBytes of disk space in the `/opt` directory.
- v The SUNWstadm package, if installed, requires between 5 and 20 MBytes of disk space in the `/var/opt/` directory and is dependent on the number of devices being monitored.
- v During normal operation, the following processes are active:
  - v `rasserv`: Application server will have 1-4 instances running at all times. This process is started upon system boot via the `/etc/rc2.d/S91rasserv` script.  
To restart, issue the following command:  

```
/opt/SUNWstade/rasserv/bin/restart
```
  - v `rasagent`: Probing agent. Will run periodically. To run manually run the following command:  

```
/opt/SUNWstade/bin/rasagent -d2
```
  - v `snmptrapd`: Trap listener on port 1162. This is automatically started by the agent (`rasagent`) if it is not active or has died.
  - v `rashttpd`: This process is started by the application server (`rasserv`) and will exist when processes are active or in the queue.
  - v `Java VM`: This process is started when needed by the probing agent for some devices and is also used for communication with certain applications. This process will be started when needed and will go away after long periods if not needed.
- v When the agent is running, the memory consumption will increase to approximately 120 MBytes for the duration of the probing. When the agent is not running the typical memory usage is about 80 MBytes if the JVM instance is needed.

Process	Memory Usage (MBytes)	Description
<code>rasagent</code>	15-40	Probing agent (only during probe)
<code>rashttpd</code>	9	Process delegation/queue
JVM	64	JVM for probing some devices
<code>snmptrapd</code>	3	SNMP trap listener (port 1162)
<code>rasserv</code>	4	Application server (1-4 instances)

# Firmware Upgrades

The Storage Automated Diagnostic Environment Enterprise Edition is a device monitoring tool that probes devices on the ethernet and, for direct attached storage devices, accesses the device in the data path (Fibre Channel).

## Stopping Monitoring

---

**Note** – For most storage arrays, it is important to stop all monitoring during upgrade operations.

---

Use the following information that best suits your site for stopping the agent from monitoring:

- v Stopping the agent

There are several ways to accomplish the task of stopping monitoring agents from probing a storage array during an upgrade.

One way would be to use the management station, if installed, to disable the specific agent from executing. This would allow for the continuing of the monitoring of other types of devices.

- v Disabling the agent from the CLI

One method to prevent the agent from monitoring is to manually remove the cron entry (See crontab(1M)). The entry for the rasagent executable would need to be removed from the root crontab.

Execute `ras_install` and select “P” to postpone the execution of rasagent from cron. This will remove the cron entry that starts the agent every 5 minutes.

---

**Note** – This will not immediately stop an existing execution of the agent. Use the `ps` command to ensure all agent activity has ended: `ps -ef | grep ras`

---

## Upgrade Information

The following information applies to firmware upgrades:

- v Brocade switch 2400 and 2800 must update to at least firmware v2.6.0g  
Reference Bug ID: 4819138
- v All communicating Master and Slave agents must be executing the same version and release level of Sun's Storage Automated Diagnostic Environment Enterprise Edition.
- v If upgrading from a version of the product n earlier than the 2.3 release, you must remove the `/var/opt/SUNWstade` directory after removing the `SUNWstade` package. See Preparing for Installation for instructions.

---

# Installing the Software

Follow the instructions in this section to prepare for software installation and install the SUNWstade base package and, optionally, the SUNWstadm management station package.

---

**Note** – If you obtained Storage Automated Diagnostic Environment Enterprise Edition bundled with a device-specific or system specific software package, this section does not apply to you. Refer to the device-specific or system-specific release notes and documentation for installation procedures.

---

## Preparing for Installation

The Storage Automatic Diagnostic Environment does not support an automatic upgrade to version 2.4 from earlier versions. You must remove any existing version before installing SUNWstade version 2.4.

1. **Run `ras_install` with the `-p` option to shut down the cron.**

```
# /opt/SUNWstade/bin/ras_install -p
```

2. **Determine what version of the Storage Automatic Diagnostic Environment is installed.**

```
# pkgparam SUNWstade VERSION
```

The system responds with the installed version number:

```
2.3
```

3. **Remove the SUNWstade package and any installed patches.**

```
# pkgrm SUNWstade
```

4. **Remove any files left under the `/opt/SUNWstade` directory and the `/opt/SUNWstade` directory itself.**

```
# /bin/rm -fr /opt/SUNWstade
```

After SUNWstade patches are installed they are typically removed by `pkgrm` of the SUNWstade package, but there are instances when some files are left under the `/opt/SUNWstade` directory.

5. **If the installed version of the Storage Automatic Diagnostic Environment was prior to version 2.3, move the `/var/opt/SUNWstade/DATA` directory to a backup.**

```
# mv /var/opt/SUNWstade/DATA /var/opt/SUNWstade/DATA.bak
```

You can remove this directory at a later date if you choose.

# Installing the SUNWstade Package

Follow the instructions below to install the SUNWstade base package:

---

**Note** – You must be logged in as superuser to install these packages and patches.

---

Find and download any of the packages and patches in the following procedure using the Sun Download Center (SDLC) web site:

<http://www.sun.com/software/download>

To install the SUNWstade package:

- 1. If it is not currently installed, download and install Java Runtime Environment (JRE) revision 1.4 or later following its installation instructions.**

---

**Note** – If you plan to install the management station package, SUNWstadm, download and install the Java Developer's Kit (JDK) instead. The JDK includes the required JRE.

---

The Java Runtime Environment (JRE) revision 1.4 or later is required by the SUNWstade Enterprise Edition package and must be installed in `/usr/j2se` or `/usr/java`. The JRE is a subset of the SDK so installation of the SDK satisfies this requirement.

- 2. If they are not installed, download and install the following SUNWsan package and patches before installing SUNWstade.**

The SUNWsan package is a requirement for installation on Solaris Data hosts. The SUNWsan package is a component of the San Foundation Software (SFS) kit ([www.sun.com/storage/san](http://www.sun.com/storage/san)). There are separate kits for each of Solaris 8 and 9. In addition to the SFS kit, the `luxadm` patches required are:

- v Solaris 8: 111413-xx (current -14) and 109529-xx (current -06)
- v Solaris 9: 113043-xx (current -08)

- 3. Do one of the following:**

To install Storage Automated Diagnostic Environment Enterprise Edition package, SUNWstade, from the Sun Sunsolve web site download site:

---

**Note** – You must use `/opt/SUNWstade` as the package base directory.

---

- a. Download the compressed SUNWstade tar image to `/tmp`.**

- b. # `cd /tmp`**

c. # `uncompress SUNWstade.tar.Z`

d. # `tar xvf /tmp/SUNWstade.tar`

e. # `pkgadd -d . SUNWstade`

To install Storage Automated Diagnostic Environment Enterprise Edition package, SUNWstade, from an installation CD:

a. # `cd /cdrom/cdrom0/product/packages`

b. # `pkgadd -d .`

c. **Select the SUNWstade package and press Return**

4. **Locate, download, and install potential patches for the Storage Automated Diagnostic Environment Enterprise Edition on Sun's Sunsolve web site using the Patch Portal at <http://sunsolve.sun.com>:**

Patch Portal -> PatchFinder -> 117650

5. **After installation, set the environment variables PATH and MANPATH to include the directories /opt/SUNWstade/bin and /opt/SUNWstade/man.**

To verify that the MANPATH is correct:

# `man ras_install`

## Installing the SUNWstadm Package

Follow the instructions below to install the optional SUNWstadm management station package:

If you intend to install only the English Language management station package, complete the following procedure only:

Installing the English Language Package

If you intend to install one or more localized management station packages, complete the following procedure also:

Installing One or More Localized Packages

## Installing the English Language Package

Follow the instructions below to install the english language management station package:

---

**Note** – You must be logged in as superuser to install these packages and patches.

---

Find and download any of the following packages and patches using the Sun Download Center (SDLC) web site:

<http://www.sun.com/software/download>

To install the SUNWstadm package:

- 1. If you haven't done so, install the SUNWstade base package. Refer to Installing the SUNWstade Package.**
- 2. The Sun (TM) Management Console (Lockhart) revision 2.1.1 or later is required by the SUNWstadm Management Station package.**

The Java Software Development Kit (SDK) revision 1.4.2\_04 or later is required by the Sun (TM) Management Console (Lockhart) and is provided in the Sun (TM) Management Console download when it is not located on the system.

On Solaris 8 systems, patches 110380-04 and 110934-16 or later must be installed in order to install the Sun (TM) Management Console (Lockhart).

If they are not installed, download and install the above packages and patches before installing SUNWstadm.

- 3. Do one of the following:**

To install Storage Automated Diagnostic Environment Enterprise Edition management station package, SUNWstadm, from the Sun Sunsolve web site download site:

- a. Download the compressed SUNWstadm tar image to /tmp.**

```
b. # cd /tmp
c. # uncompress SUNWstadm.tar.Z
d. # tar xvf /tmp/SUNWstadm.tar
e. # pkgadd -d . SUNWstadm
```

To install age the Diagnostic Environment Enterprise Edition management station package, SUNWstadm, from an installation CD:

- ```
a. # cd /cdrom/cdrom0/product/packages
b. # pkgadd -d .
```
- c. Select SUNWstadm and press Return.**

4. The `/opt/SUNWstade/bin/ras_install` is run during the SUNWstade package installation. If you need to change the default settings of Master, Cron enabled, or the default locale; rerun `ras_install` program and choose the desired settings:

```
# /opt/SUNWstade/bin/ras_install
```

---

**Note** – Steps 4, 5, and 6 are unnecessary if you performed them during installation of the base package, SUNWstade.

---

5. Locate, download, and install potential patches for the Storage Automated Diagnostic Environment Enterprise Edition management station on Sun's Sunsolve web site using the Patch Portal at <http://sunsolve.sun.com>:

Patch Portal -> PatchFinder -> 117650

6. Set the environment variables `PATH` and `MANPATH` to include the directories `/opt/SUNWstade/bin` and `/opt/SUNWstade/man`.

To verify the `MANPATH`: # `man ras_install`

7. Define the `sa_admin` role and administrative users

Users can log into the Storage Automated Diagnostic Environment Enterprise Edition management station using their standard UNIX account, but they will be limited in what they are permitted to do unless they have the assigned role of `sa_admin`.

Discovery, management of remote devices, and running diagnostics are restricted operations that are only permitted for users associated with the `sa_admin` role.

The following example creates the `sa_admin` role and assigns the password "diags" to that role:

```
a. # roleadd -c "SA Role" -s /bin/pfcsch -A "solaris.*" -P "All"
    sa_admin
```

```
b. # passwd sa_admin    ### Use password diags
```

The following example creates a user named `admin`, also with password "diags," and assigns the user the `sa_admin` role:

```
a. # useradd -c "SA Admin" -s /bin/csh -R sa_admin -A
    "solaris.*" admin
```

```
b. # passwd admin    ### Use password diags
```

The following example assigns the `sa_admin` role to an existing user named `olduser` and verifies the user's role:

```
a. # usermod -c "SA Admin" -R sa_admin -A "solaris.*"
    olduser
```

```
b. # roles olduser sa_admin
```

---

**Note** – If a network nameserver such as NIS or NIS+ is being used to supplement the local `/etc/passwd` file with additional entries, `roleadd` or `rolemod` cannot change the information provided by the network nameserver.

---

Refer to `roleadd(1M)`, `rolemod(1M)`, `roledel(1M)`, and `roles(1M)` for more information on role management. Refer to `useradd(1M)`, `usermod(1M)`, and `userdel(1M)` for information on user login management.

## Installing One or More Localized Packages

Follow the instructions below to install one or more localized management station package:

---

**Note** – You must be logged in as superuser to install these packages and patches.

---

Find and download any of the required packages and patches using the Sun Download Center (SDLC) web site:

<http://www.sun.com/software/download>

Or get the CD that contains Storage Automated Diagnostic Environment Enterprise Edition localized software.

This release of Storage Automated Diagnostic Environment Enterprise Edition software supports English, French, Japanese, Korean, Simplified Chinese and Traditional Chinese locales.

---

**Note** – Man pages are available only in English and Japanese. Release notes are available in English, French, Japanese, Korean, Simplified Chinese and Traditional Chinese.

---

The software package names of the supported locales are listed below:

- v French (fr):SUNWstafr
- v Japanese (ja):SUNWstaja
- v Korean (ko):SUNWstako
- v Simplified Chinese (zh):SUNWstazh
- v Traditional Chinese (zh\_TW):SUNWstzt

---

**Note** – Any combination of the five localized packages can be installed in your system.

---

To install a localized version of the Storage Automated Diagnostic Environment Enterprise Edition:

1. **Stop the agent from polling:** # /opt/SUNWstade/bin/ras\_install -p
2. **Remove any package currently installed using one of the following commands:**
  - # pkgrm SUNWstaf
  - # pkgrm SUNWstaja
  - # pkgrm SUNWstako
  - # pkgrm SUNWstazh
  - # pkgrm SUNWstazt
3. **If you haven't done so, install the English language version of the Storage Automated Diagnostic Environment Enterprise Edition. Refer to the *Storage Automated Diagnostic Environment Enterprise Edition Release Notes* for instructions.**
4. **If you haven't done so, install the English language version of the Storage Automated Diagnostic Environment management station. Refer to *Installing the English Language Package* for instructions.**
5. **Do one of the following:**
  - v To install a localized Storage Automated Diagnostic Environment Enterprise Edition package from the Sun Sunsolve web site download site:
    - a. **Download the compressed tar image for the package to /tmp.**
    - b. # cd /tmp
    - c. # uncompress <packagename>.tar.Z
    - d. # tar xvf /tmp/<packagename>.tar
    - e. # pkgadd -d . <packagename>  
where packagename is the name of the localized package you are installing.
  - v To install the localized Storage Automated Diagnostic Environment Enterprise Edition package from a CD:
    - a. # cd /cdrom/cdrom0/product/L10N
    - # pkgadd -d . <packagename>  
where packagename is the name of the localized package you are installing.

---

# Getting Started

If you installed the SUNWstade base package only, use the following CLI-based procedure to complete initial set up requirements:

Setting Up the Software With the CLI

If you installed the SUNWstadm management station package, you have the option to use the following GUI-based procedure to complete initial set up requirements:

Setting Up the Software With GUI

---

**Note** – If there are existing problems with a storage device when the package is installed, these problems may not be detected or reported. They will, however, generate an event (type of event is based on the type of failure) when the error condition is corrected.

---

## Setting Up the Software With the CLI

---

**Note** – If you obtained Storage Automated Diagnostic Environment Enterprise Edition bundled with a device-specific or system specific software package, this section does not apply to you. Refer to Setting Up the Software With GUI or refer to the device-specific or system specific release notes for setup procedures.

---

The following procedure allows the user to set up Storage Automated Diagnostic Environment Enterprise Edition on a host server that does not have the GUI management package installed (SUNWstadm). This procedure will guide the user through the steps necessary to properly initialize the product using Command Line Interface (CLI) commands.

To set up the Storage Automated Diagnostic Environment Enterprise Edition from the CLI:

---

**Note** – In the example procedures that follow, the name of the host where the Storage Automated Diagnostic Environment Enterprise Edition is installed is referred to as acmetw4.

---

## 1. Enter Site Information

### a. Change to the /opt/SUNWstade/bin directory:

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

### b. Execute the ras\_admin command specifying the function argument

```
site_info_upd.
```

```
# root@acmetw4 ./ras_admin site_info_upd
```

### c. Follow the prompts to supply the information requested.

---

**Note** – Prompts marked with an asterisk (\*) are required fields.

---

A typical set of Site Information prompts is shown below.

```
Enter Customer*           : ACME Tools and Die Inc.
Enter Contract            :
Enter Ticker              : ACME
Enter Cust no             :
Enter Site name*          : ACME Tool Works Site #4
Enter Site address        : 123 Anystreet Blvd.
Enter Site city*          : Hometown
Enter Site state          : Colorado
Enter Site zip*           : 80000
Enter Site country*       : USA
Enter Site contact*       : John Smith
Enter Site contact phone  : (888) 555-9876
Enter Site email*         : john.smith@acme.com
Do you want to save these values [y=yes, n=no, q=quit]: y
```

a. Enter y to save the specified Site Information.

## 2. Discover Devices

You can discover devices in one or more of three ways:

### v Discover devices out-of-band using a device configuration file

The device configuration file is /etc/deviceIP.conf. It looks a great deal like a hosts definition file. The /etc/deviceIP.conf file may be utilized for discovery of all supported fibre channel devices that have ethernet connectivity and whose IP address and device types are known.

- v Discover devices out-of-band using the search subnet method

To use this method, you must specify the device names as they are defined in the `/etc/hosts` file or specify IP addresses to discretely discover those devices. An alternative is to blindly search the subnet - but this takes much longer and may add devices that are not part of this systems configuration (requiring you to manually remove them later).

---

**Note** – Devices that do not have out-of-band connectivity cannot be discovered using the device configuration file or subnet search method. These devices include the Sun StorEdge 3120 JBOD Array, the Sun StorEdge 3310 JBOD Array, the Sun A5x00 Array, and the Sun 3500FC Array. You must discover these devices using the in-band discovery method.

---

- v Discover devices in-band

Some devices do not provide out-of-band management paths, discovery must use the in-band path to find the device. Typically, devices such as HBAs, and JBOD arrays without out-of-band management must be discovered this way.

---

**Note** – This method is not required if you choose one of the previous methods to discover your devices, it will not add any new information about those devices.

---

To discover devices using the a device configuration file:

- a. **Change your directory to the `/etc` directory:**

```
# root@acmetw4 cd /etc
```

- b. **Use a text editor to open the `/etc/deviceIP.conf` file.**

```
# root@acmetw4 vi deviceIP.conf
```

- c. For each device to be discovered, specify the device IP, device name, device type, and comments using the following syntax:

```
device_ip device_name [device_type] #comments
```

The device\_name will be used if the device name cannot be retrieved from the device itself.

The device\_type is required for devices that do not support SNMP, including Sun StorEdge 3xx0 devices such as the Sun StorEdge 3510/3310 devices, and SAM-QFS.

Some examples of device entries follow.

| IP Addr  | Name   | Type  | Comments                               |
|----------|--------|-------|----------------------------------------|
| 10.0.0.1 | t3-1a  |       | # My T3a array                         |
| 10.0.0.2 | fc3510 |       | # My SE-3510 (uses SNMP for discovery) |
| 10.0.0.3 | 3900   | se    | # My SE-3910 array                     |
| 10.0.0.4 | sam    | samfs | # SAM-QFS                              |

Valid device type entries are:

---

|           |        |          |           |
|-----------|--------|----------|-----------|
| • mcdata  | • 5210 | • 9900   | • 6130    |
| • samfs   | • t3   | • 6020   | • 6120    |
| • se      | • se2  | • switch | • switch2 |
| • 3310    | • 3510 | • 3511   | • inrange |
| • brocade |        |          |           |

---

- d. Save the updated device configuration file.

- e. Change your directory to the /opt/SUNWstade/bin directory:

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**f. Execute the `ras_admin` command specifying the function argument `discover_deviceIP` to use the `/etc/deviceIP.conf` file:**

```
# root@acmetw4 ./ras_admin discover_deviceIP
```

The following is a typical execution of the discovery process using `/etc/deviceIP.conf`:

```
Reading deviceIP: 172.20.35.175 acmetw4-480a # Test Host
Start Discover::fromIP on 172.20.35.175
- snmp sysDesc is Sun SNMP Agent, Sun-Fire-480R
- found 1 device(s) using Discover::6130
Reading deviceIP: 172.20.35.32 etw4-lsi8 # Single SE-6130 Array
Tray
Start Discover::fromIP on 172.20.35.32
- found 1 device(s) using Discover::6130
Reading deviceIP: 172.20.35.102 etw4-sw102 # 2Gb 16 port Qlogic
Switch
Start Discover::fromIP on 172.20.35.102
- snmp sysDesc is QLogic SANBox2 FC Switch
- found 1 device(s) on Discover::Switch
Reading deviceIP: 172.20.35.192 acmetw4-sw192 # 1Gb 8 port Qlogic
Switch
Start Discover::fromIP on 172.20.35.192
- snmp sysDesc is SANbox1-8
- found 1 device(s) on Discover::Switch
Adding devices from deviceIP.local to configuration:
adding device : acmetw4-480a/200600a0b816f5f4/ip=172.20.35.32
merging device : acmetw4-lsi8/200600a0b816f5f4/ip=172.20.35.32
adding device : acmetw4-sw102/100000c0dd00bfda/ip=172.20.35.102
adding device : acmetw4-sw192/100000c0dd005732/ip=172.20.35.192
```

To discover devices using the search subnet method:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument**

discover\_subnet **with the argument** -I ipaddr,ipaddr...ipaddr

```
# root@acmetw4 ./ras_admin discover_subnet -I 'acmetw4-480a,172.20.35.32,acmetw4-sw102,acmetw4-sw192'
```

A typical discovery process using the subnet method follows.

```
Start Discover::fromIP on 172.20.35.175
- snmp sysDesc is system.sysDescr.0 = Sun SNMP Agent, Sun-Fire-480R
- found 1 device(s) using Discover::6130
Start Discover::fromIP on 172.20.35.32
- found 1 device(s) using Discover::6130
Start Discover::fromIP on 172.20.35.102
- snmp sysDesc is system.sysDescr.0 = QLogic SANBox2 FC Switch
- found 1 device(s) on Discover::Switch
Start Discover::fromIP on 172.20.35.192
- snmp sysDesc is system.sysDescr.0 = SANbox1-8
- found 1 device(s) on Discover::Switch
Adding devices from subnet.local to configuration:
adding device : acmetw4-480a/200600a0b816f5f4/ip=172.20.35.32
adding device : acmetw4-sw102/100000c0dd00bfda/ip=172.20.35.102
adding device : acmetw4-sw192/100000c0dd005732/ip=172.20.35.192
merging device : acmetw4-lsi8/200600a0b816f5f4/ip=172.20.35.32
device : acmetw4-lsi8/200600a0b816f5f4/ip=172.20.35.32
```

To discover devices in-band:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument**

discover\_inband:

```
# root@acmetw4 ./ras_admin discover_inband
```

A typical discovery process using the inband method follows:

```
Discover::inband: trying Discover::3310
Discover::inband: trying Discover::6130
- found 1 device(s) using Discover::6130
Discover::inband: trying Discover::A3500FC
Discover::inband: trying Discover::Luxadm
Discover::inband: trying Discover::HBAApi
-> INBAND TOPO dis_hba
-> INBAND TOPO dis_luxadm
-> INBAND TOPO dis_devinfo
Start Discover::fromIP on 172.20.35.102
- snmp sysDesc is QLogic SANBox2 FC Switch
- found 1 device(s) on Discover::Switch
Start Discover::fromIP on 172.20.35.192
- snmp sysDesc is SANbox1-8
- found 1 device(s) on Discover::Switch
- found 2 device(s) using Discover::HBAApi
Adding devices from inband.local to configuration:
adding device : acmetw4-sw102/100000c0dd00bfda/ip=172.20.35.102
adding device : acmetw4-sw192/100000c0dd005732/ip=172.20.35.192
merging device : acmetw4-lsi8/200600a0b816f5f4/ip=172.20.35.32
```

**3. Initialize all agents to report in to the Storage Automated Diagnostic Environment Enterprise Edition. This step is required to be run on all slave hosts that will report into the master agent.**

```
example: # /opt/SUNWstade/bin/ras_install -s <hostname>
```

where hostname is the IP name or IP address of the host on which the master agent is installed.

#### 4. Setup Notification Providers

Notification setup is required to ensure that should something adverse occur to your storage network, the Storage Automated Diagnostic Environment Enterprise Edition can notify someone about the problem. There are two classes of notification providers: local notification and remote notification. Local notification methods include local Email, SNMP traps, and SunMC. Remote notification methods are specifically targeted at Sun Service and include NSCC email and Net Connect.

To set up local Local Email notification:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument email\_add with the argument -e <email address of user>**

```
#root@acmetw4-480a ./ras_adminemail_add -e employee1@acmetw2.com
```

**c. Repeat Step b. for each email notification recipient you want to add.**

A list of the current email notification recipients is displayed.

| Entry | Email/Events          | Type  | Device | Priority | Events |
|-------|-----------------------|-------|--------|----------|--------|
| 1     | employee1@acmetw4.com | Email | All    | All      | All    |
| 2     | employee2@acmetw2.com | Email | All    | All      | All    |

To set up SunMC notification:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument provider\_on with the argument -p sunmc -f <report frequency> -i <sunmc server address>.**

In the following example, the SunMC host is acmetw4-sunmc and the reporting frequency is 1 hour.

```
# root@acmetw4-480a ./ras_admin provider_on -p sunmc -f 1 -i acmetw4-sunmc
```

To set up an SNMP Trap notification recipient:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument**

provider\_on **with the argument** -p trap -i <SNMP receiver address> -o <SNMP port> -l <notification level> -t <trap slot number>.

In the following example, the SNMP trap receiver host is acmetw4-openview, the trap port number is 1992, the desired reporting level is 'error' and this is the first of five possible definitions in the SNMP traps table.

```
# root@acmetw4-480a ./ras_admin provider_on -p trap -i acmetw4-openview -o 1992 -l error -t 1
```

To enable NSCC notification:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument**

provider\_on **with the argument** -p nsc\_email.

```
# root@acmetw4-480a ./ras_admin provider_on -p nsc_email
```

To enable Net Connect notification:

**a. Change your directory to the /opt/SUNWstade/bin directory**

```
# root@acmetw4 cd /opt/SUNWstade/bin
```

**b. Execute the ras\_admin command specifying the function argument**

provider\_on **with the argument** -p netconnect.

```
# root@acmetw4-480a ./ras_admin provider_on -p netconnect
```

## 5. Check the revision of devices:

```
# root@acmetw4-480a ./ras_revcheck -h acmetw4-480a -M ALL -p
```

The following is a typical revision report display:

| Type                                                                                           | Name                                           | Status  | Curr_Ver         | Expect_Ver       | Curr_Patch | Expect_Patch                    | Comments                   |
|------------------------------------------------------------------------------------------------|------------------------------------------------|---------|------------------|------------------|------------|---------------------------------|----------------------------|
| 6130_Controller                                                                                | acmetw4-480a.firmrev                           | DOWNREV | 06.10.05.11      | 06.10.09.11      | N/A        | no patch information            |                            |
| available, please contact your sun representative                                              |                                                |         |                  |                  |            |                                 |                            |
| 6130_NVSRAM_FW                                                                                 | acmetw4-480a.nvsram                            | DOWNREV | N2882-610843-010 | N2882-610843-011 | N/A        | no patch information available, |                            |
| please contact your sun representative                                                         |                                                |         |                  |                  |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.1                    | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.10                   | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.11                   | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.12                   | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.13                   | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.14                   | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.2                    | PASS    | 0307             | 0307             |            |                                 |                            |
| 6130_DISK_FW                                                                                   | acmetw4-480a.Tray.0.Drive.3                    | PASS    | 0307             | 0307             |            |                                 |                            |

## 6. Run the Agent (Optional)

Once Storage Automated Diagnostic Environment Enterprise Edition is installed, a cron job is set up to run the agent automatically.

This optional step may be performed to force an agent run out of cycle, but is not required since the monitoring agent cron runs once every five minutes by default. Running the agent now will cause notification to occur from the previous setup steps.

```
# root@acmetw4-480a ./rasagent -d2
```

```
Agent running /opt/SUNWstade/DATA/rasagent.conf on 09-24 11:02:01,
MASTER acmetw4-480a
```

## 7. Examine the Topology details (Optional)

Review your topology details by first getting the name of the topology to view using `topo_list` argument to `ras_admin` then displaying the details of that topology using `ras_admin topo -t <topo_name>`.

In the following example, we view the topology for our newly installed system, `acmetw4-480a`.

```
# root@acmetw4-480a ./ras_admin topo_list
Name                               Date
-----
acmetw4-480a                       2004-09-24 11:15:03
MERGE-MASTER                       2004-09-24 11:15:04
Done.
# root@acmetw4-480a ./ras_admin topo -t acmetw4-480a.

## Setting Up the Software With GUI

Follow the instructions in this section to get started setting up the Storage Automated Diagnostic Environment using the GUI.

---

**Note** – After logging in, refer to the online help for more information on the steps in this section.

---

1. **From a web browser, log in the Sun Web Console using URL**  
`https://<hostname>:6789.`
  - a. **Enter the User Name that was defined in the Installation Instructions, Step 7.**
  - b. **Enter the Password that was defined in the Installation Instructions, Step 7.**
  - c. **Select the `sa_admin` role from the pull-down list.**
  - d. **Enter the Password that was defined for the `sa_admin` role in the Installation Instructions, Step 7.**
  - e. **Click Log In.**
2. **Click Storage Automated Diagnostic Environment**
3. **Enter your Site Information**
  - a. **Click Storage Automated Diagnostic Environment.**
  - b. **Complete the required fields on the Site Information page.**
  - c. **Click Save.**

---

**Note** – Fields marked with a red asterisk are mandatory. You will be unable to continue until this page is completed and saved successfully.

---

#### 4. Review hosts

##### a. Select the Inventory Tab

##### b. Verify that host information is entered correctly and that all expected hosts are present.

---

**Note** – Peer hosts are added by running the following CLI command on the peer host: `# ras_install -s <IPofMaster>`

where IPofMaster is the IP address or IP name of the host running the master instance of Storage Automated Diagnostic Environment Enterprise Edition.

---

#### 5. Discover Devices

Three methods of device discovery are available:

- v In-Band
- v Out-of-Band searching for specified IP addresses or device names
- v Out-of-Band searching for devices specified in a preconfigured device configuration file

To discover devices using the In-Band method:

##### a. Select the Inventory Tab -> Discovery.

##### b. Select the appropriate agent or All Agents from pull-down list. (Note: The selected agents must have in-band access to the desired devices.)

##### c. Select Inband from the Discovery Mechanism pull-down list.

##### d. Optionally, choose a device-naming convention by making a Prefix selection.

##### e. Accept the remaining defaults and click Start Discovery.

To discover devices using the Out-of-Band (IP) method:

##### a. Select the Inventory Tab -> Discovery.

##### b. Select the appropriate agent or All Agents from pull-down list. (Note: The selected agents must have intranet access to the desired devices.)

##### c. Select IP from the Discovery Mechanism pull-down list.

##### d. Specify the IP addresses to be discovered.

##### e. Optionally, choose a device-naming convention by making a Prefix selection.

##### f. Accept the remaining defaults and click Start Discovery.

To discover devices using the Out-of-Band (File) method:

- a. Enter the desired devices into the selected agents `/etc/deviceIP.conf` file.
- b. Select the Inventory Tab -> Discovery.
- c. Select the appropriate agent or All Agents from pull-down list. (Note: The selected agents must have intranet to the desired devices.)
- d. Select File from the Discovery Mechanism pull-down list.
- e. Click Start Discovery.

## 6. Run Revision Analysis

Revision Analysis should be run after installation and whenever new components are added to the system. Updating all firmware and software components to the current revisions ensures that the devices have the capabilities required to be discovered, monitored and diagnosed properly.

- a. Select the Administration tab.
- b. From the Actions pull-down list, select Run Revision Analysis.
- c. Select the Host on which Revision Analysis is to run, the Revision Matrix to be used for revision checking, All modules, and, if desired, enter an email address to which the results will be sent.
- d. Click Run.

## 7. Setup Notification

You can configure a number of methods for generating notification of alarm conditions:

- v Notification to one or more Email addresses
- v Notification to one or more of remote Sun notification recipients and SNMP trap recipients

To configure Email recipients:

- a. Select Administration -> Notification -> Setup.
- b. To enable Local email, add the desired SMTP server under the Email Notification Setup section called "Use this SMTP server for Email".

---

**Note** – If the host running this software has the `sendmail` daemon running, you can enter `localhost` or the name of this host in this field.

---

- c. Click Save to verify the email configuration.
- d. Click the Email tab.

- e. Enter one or more email addresses for local notification. Specified addresses receive email notifications when events occur. Emails can be customized to specific severity, event-type, or product type.

To configure SNMP trap recipients:

- a. Select Administration -> Notification -> Setup.
- b. In the Remote Notification Setup section, check SNMP Trap.
- c. Click the SNMP tab.
- d. Click New.
- e. For each SNMP recipient you want to add, specify the name or IP Address of the recipient, the port on which to send traps, and, optionally, the minimum alert level for which you want SNMP notification, and click OK.

To configure remote notification recipients:

- a. Select Administration -> Notification -> Setup.
- b. Check the box next to each Remote Notification provider you want to enable.
- c. Complete the setup parameters for any remote notification recipient that you enable.
- d. Click Save.

#### 8. Run the Agents:

You can manually run the monitoring agents.

- a. Select the Administration Tab -> Agents.
- b. Click the check box for the agent you want to run.
- c. Click Run Agent.

---

**Note** – If you do not click Run Agent, the selected agents will automatically run after 5 minutes.

---

- d. Repeat steps b and c for each agent.

#### 9. Review Topology:

- e. Select Topology.
- f. Display the topology from each agent as well as a master view.

---

# Device and Product Use Information

This section provides general and device- and product-specific information for using the product.

## Browser

- v System administrators should know about security risks associated with installing a web server. Take the appropriate actions to protect access to the Storage Automated Diagnostic Environment port 6789.
- v Some browsers such as Netscape 7 will prompt for a username/password when applets are loaded. Enter the same username/password which was used to initially log in.
- v Support for Inrange switches includes topology and port status only.

## Localization

The following information applies to localization of the product.

- v For the online help content of the Korean locale, the default font size in the Netscape or Mozilla browsers may be too small to read.  
You can select your choice of font size in Netscape or Mozilla browser by: selecting an appropriate "Minimum font size" in the Edit -> Preferences -> Appearance -> Fonts menu of your browser. For example, you can select "12" or "14" as "Minimum font size".  
Or you can select an appropriate "Text Zoom" choice in the browser's View menu.
- v You can update your Shell Environment to display Japanese man pages.  
To display the man pages in Japanese using the man page command, you must use ja locale and update your MANPATH variable with one of the following procedures.  
To update your MANPATH Variable in a Bourne or Korn Shell:
  - i. Update your .profile file MANPATH statement to include /opt/SUNWstade/man and make sure your MANPATH is exported.**

```
# MANPATH=$MANPATH:/opt/SUNWstade/man
# export MANPATH
```
  - ii. Save this file and exit the editor.**

**iii. Reload your .profile file for your shell session.**

```
# . ~/.profile
```

To update Your MANPATH Variable in a C Shell:

**i. Add /opt/SUNWstade/man to your MANPATH statement in your .login file:**

```
setenv MANPATH $MANPATH:/opt/SUNWstade/man
```

**ii. Save this file and exit the editor.**

**iii. Reload your .login file for your shell session.**

```
# source .login
```

- v You can display Simplified Chinese version of the user interface in Netscape Navigator by selecting zh-cn as the Navigator Language Preference option using Edit > Preferences > Navigator > Languages.
- v This release does not support localization of Email, Pager, and SNMP notification messages. However, site information that is included in notification messages can be localized if you:
  - v Enter localized characters in the text input fields of the Site Information page (Administration > General Setup > Site Information).
  - v Use an Email system that supports UTF-8 encoding.

Otherwise, notification messages are received with garbled characters in place of the site information fields. If you are not sure if your Email system supports UTF-8 encoding, enter and save only ASCII characters in the Site Information text fields.

- v The localized characters of one language may not display correctly in another language version browser if the browser does not fully support UTF-8 encoding and have the required language fonts.

## Sun StorEdge 5210 NAS

Use this procedure for setting up the SE 5210 device to send SNMP traps to the Storage Automated Diagnostic Environment Enterprise Edition host:

- 1. Start up the SE 5210 device Web Admin application by entering the IP address of the device in your web browser and pressing Return.**
- 2. Enter the device password and click Apply.**
- 3. From the Web Admin sidebar, select Monitoring and Notification -> Configure SNMP.**
- 4. Check the Enable SNMP check box.**

5. Enter "public" in the Server SNMP Community Field.
6. Enter the IP address of the Storage Automated Diagnostic Environment Enterprise Edition host in the Destination IP address column.
7. Enter "1162" in the corresponding Port # column. Port 1162 is the port on which the Storage Automated Diagnostic Environment Enterprise Edition listens for SNMP traps.
8. Enter "2" in the Version column.
9. Enter "public" in the Community column.
10. Check the Enable check box.
11. Click Apply.  
Your SNMP changes are saved.

## Sun StorEdge 3310, 3510, and 3511 Arrays

This release provides limited password support for 3310, 3510 and 3511 devices. You can monitor the 3310/3510/3511 devices with password setup but be aware of the following:

- v Password setup has no effect on in-band discovery or monitoring.
- v If you monitor the devices Out-Of-Band (OOB) consider: the following:
  - v Before the 3310/3510/3511 device is added in the Storage Automated Diagnostic Environment Enterprise Edition, if the password has been set up on the device either through the firmware GUI or sccli command line (or some other management software), when you add the device you must supply the correct password.
  - v If the device is already being monitored by the Storage Automated Diagnostic Environment Enterprise Edition (rasagent has been run at least one time), you must change the 3310/3510/3511 password through the firmware GUI or sccli (or some other management software). Then you must update the device password using the Storage Automated Diagnostic Environment Enterprise Edition GUI. Failure to do this will result in Lost Communication.

To update the password:

```
# /opt/SUNWstade/bin/ras_admin password_change -i <ipaddress> -p <password>
```

where ipaddress is the IP address of the device and password is the password you are assigning to the device.

---

**Note** – If you want to run the out-of-band diagnostic functions (ex. write/read buffer test, loopback test, echo test, etc.) for the 3510 device you must disable the password first. There are no diagnostic functions for the 3310/3511 arrays at this time.

---

- v You cannot set up the password directly for the 3310/3510/3511. When you update the device password from the Storage Automated Diagnostic Environment Enterprise Edition GUI it only updates the password information used by the Storage Automated Diagnostic Environment Enterprise Edition. It does not change the password on the array. You must use the array GUI or `scli` command (or some other management software) to configure the password on the array.
- v The 3120 and 3310 JBOD do not support passwords. Passwords only apply to an array with controller.
- v The following Sun StorEdge firmware levels are required before installing this release:
  - v Sun StorEdge 3510 FC RAID f/w 3.27r SES 1040 or greater. Patch ID 113723-07
  - v Sun StorEdge 3310 SCSI Raid 3.25s SAF-TE 1159 or greater. Patch ID 113722-05
- v The 3510/3310 implements a disk probe utility “Periodic Drive Check Time” to periodically check drive availability.  
Set this value to 30 seconds.

## Brocade

Brocade FC Switch configurations using QuickLoop ports can be monitored and diagnosed but the topology views will not show connections between devices.

## SAM-FS/QFS

The following information applies to the SAM-FS/QFS product.

- v `SUNWsamfs` version 4.1 or higher is required for the SAM-QFS SNMP feature.
- v `SUNWsamfs` version 4.2 or higher is required for the SNMP traps, Asset/Health Instrumentation, Log Parsing and Device Firmware Revision Checking.
- v This process must be implemented from a root login.
- v By default SNMP alerts are turned on. To ensure this check the `/etc/opt/SUNWsamfs/defaults.conf` file for a line that reads 'alerts=off'. If necessary change it to 'alerts=on'.

- v If you needed to turn 'alerts on' in Step 2 then you must restart SAM-QFS as follows:
  - i. `/opt/SUNWsamfs/sbin/samd stop`
  - ii. `/opt/SUNWsamfs/sbin/samd config`
  - iii. `/opt/SUNWsamfs/sbin/samd start`
- v Set the trap destination in `/etc/opt/SUNWsamfs/scripts/sendtrap`. By default it is set to the local host as follows:
 

```
TRAP_DESTINATION=`hostname`
```

 Change TRAP\_DESTINATION to read:
 

```
TRAP_DESTINATION=`hostname`:1162
```

 Example: `TRAP_DESTINATION=172.20.35.00:1162`  
 or: `TRAP_DESTINATION=Fido:1162`  
 Sets the trap destination to the NIS named host "Fido" port 1162.  
 or: `TRAP_DESTINATION=`hostname`:1162`  
 Sets the trap destination to the local host port 1162.

---

**Note** – Port 1162 is the general SNMP trap listener for the Storage Automated Diagnostic Environment Enterprise Edition and for this patch it cannot be changed. This port is shared by other agents who receive traps processed by the Storage Automated Diagnostic Environment Enterprise Edition.

---

- v For full functionality of Storage Automated Diagnostic Environment Enterprise Edition with SAM-QFS 4.2 it is required that Storage Automated Diagnostic Environment Enterprise Edition (master or slave) be installed on the same host as the SAM-QFS 4.2 that you wish to monitor. If you chose to monitor SAM-QFS 4.1 or 4.2 remotely (meaning that Storage Automated Diagnostic Environment Enterprise Edition master is installed on a host other than that of the SAM-QFS installation) then only the SNMP trap support described for SAM-QFS 4.1 will be in affect.

## Solaris

If the Solaris host that the Master is installed on uses 'compat' in the `/etc/nsswitch.conf` file, the Administrator must manually set the User Password. Checking the "NIS Password" box does not work in conjunction with 'compat'.

## HDS

In order to monitor HDS, the monitoring host must be given SNMP access to the HDS array.

## JNI HBAs

If you had JNI HBA cards installed with the previous version of SUNWstade, you will need to run topology discovery again in order for this release to see the JNI HBA cards.

---

## Known Issues

This section identifies known issues with the SUNWstade and SUNWstadm product components.

### SUNWstade Issues

This section identifies known issues with the SUNWstade base package.

- v Diagnostic tests on slaves with Perl 5.8+ do not function correctly. The user must login to the slave and execute the diagnostics from the CLI.

Reference BugId: 5076153

- v Alarms generated when components are removed, are not automatically cleared from the Alarm page when the component is reinstalled. You must clear the alarm manually.

Reference BugId: 5090092

- v Alarms which have the Type of "Log" are not automatically removed when the condition that caused the alarm is corrected. You must remove them manually when they no longer apply.

Reference BugId: 6186308

- v Removal of an SFP will result in the SFP no longer appearing in the GUI (FRU Summary page). When the SFP is replaced it will reappear in the GUI.

Reference BugId: 5089234

- v When using Mozilla, and you use multiple tabs in one session, you may experience incorrect linking. To avoid this, do not use multiple tabs.

Reference BugId: 5092555

- v The 3120/3310 JBOD revision check only supports a safe firmware check (1159). A `sccli F/W` problem (listed below) prevents the disk revision check on both of these devices.

Reference BugId: 5044120 “3310/3120 JBOD - Not displaying disk information”

- v The 3511 revision check supports the following:
  - v System firmware rev check. (3.27R)
  - v SES check (P296)
  - v `pld` check (0C00)
  - v SR-1216 router check (0548)
  - v `pc-150 FC-SATA MUX` (0100)
  - v Disk SUPPORT: HDS72252 / 5VLSA80 (A660) [vendor / model # (version)]
- v The SAM-QFS product does not provide a means (remotely) for the Storage Automated Diagnostic Environment Enterprise Edition to determine when, on which host, or what version of SAM-QFS is installed. It is therefore possible for the user to add an instance SAM-QFS to the Storage Automated Diagnostic Environment Enterprise Edition that either does not exist or is of some version lower than 4.1.

No adverse conditions or errors will occur, however the Storage Automated Diagnostic Environment Enterprise Edition would never receive an SNMP trap or post an alarm for that instance of SAM-QFS.

- v The Storage Automated Diagnostic Environment Enterprise Edition instruments the SAM-QFS application and not tape drives and libraries themselves. Therefore, it only has knowledge of issues with hardware devices after SAM-QFS has attempted to access them. For example, if a tape drive loses power, the Storage Automated Diagnostic Environment Enterprise Edition will not issue an alarm or notify the user until SAM-QFS has attempted to use or perform I/O to that tape drive. It is possible that SAM-QFS may go for several hours without accessing a tape drive or library.
- v The Administrator needs to ensure that only real instances of SAM-QFS version 4.1 or 4.2 are added. The IP number displayed on the Devices page must be accurate. This IP is not used to communicate with the SAM-QFS host, but it is necessary in order for the Storage Automated Diagnostic Environment Enterprise Edition to determine which host an SNMP trap came from. Multiple instances of SAM-QFS are supported in the Storage Automated Diagnostic Environment Enterprise Edition.
- v CLI tests `switchtest` and `linktest` may not provide diagnostics for fibre channel links between downrevisioned HBAs and/or downrevisioned switches as well as fibre channel links between switches and virtualization engines (VE). This is a result of the lack of support for the fabric ECHO test command in these products.

# SUNWstadm Issues

This section identifies known issues with the SUNWstadm management station package.

- v The installation of SUNWstadm may fail after the installation when SUNWstadm attempts to start the Sun(TM) Management Console for the first time on the system. If you encounter one of the following errors you will need to make the suggested changes and start the console manually.

- v SUNWstadm: Starting the Sun(TM) Web Console.  
Starting Sun(TM) Web Console Version 2.1.1...  
Startup failed: cannot assume user identity "noaccess".  
Check to make sure "noaccess" has a valid login shell.  
  
Workaround: Remove the /usr/bin/true entry from the /etc/passwd with the following command:

```
# passmgmt -m -s "" noaccess
```

- v SUNWstadm: Starting the Sun(TM) Web Console.  
Starting Sun(TM) Web Console Version 2.1.1...  
su: No shell  
Startup failed: cannot assume user identity "noaccess".  
Check to make sure "noaccess" has a valid login shell.  
  
Workaround: Modify the permissions on the root directory so that "others" (noaccess) have both read and execute permissions.

- v SUNWstadm: Starting the Sun(TM) Web Console.  
Starting Sun(TM) Web Console Version 2.1.1...  
Startup failed. See /var/log/webconsole/console\_debug\_log for detailed error information.

```
# tail -2 /var/log/webconsole/console_debug_log  
Error occurred during initialization of VM  
java.lang.Error: Properties init: Could not determine current  
working directory.
```

Workaround: Modify the permissions on the root directory so that "others" (noaccess) have both read and execute permissions.

Once the workaround is applied start the Sun(TM) Web Console using the following command:

```
# /usr/sadm/bin/smcwebserver start
```

Reference BugId: 5109055 Web Console startup fails when the root directory restricts other access

- v If you select Update Monitoring and Setup Data or attempt to launch a configured supporting application on the Devices page, you must have pop-ups enabled in your browser.

- v The Sun(TM) Management Console may report the following error when you select the advance sort button under Administration of the Storage Automated Diagnostic Environment Enterprise Edition management station:
 

```
java.io.IOException: Illegal to flush within a custom tag
```

 If this occurs you will need to upgrade Tomcat to version 4.0.3 or later.
- v The Sun (TM) management station (Lockhart) package, SUNWstadm, requires the Java Software Development Kit (SDK) revision 1.4.2\_04 or later. Currently the installation of Lockhart may detect that the Java Runtime Environment (JRE) is installed and use this rather than the SDK. When this occurs, attempts to log into the Storage Automated Diagnostic Environment Enterprise Edition management station fail.
 

If this occurs, inspect Lockhart's `java.home` setting using the Lockhart `smreg(1M)` command as follows:

```
# /usr/sbin/smreg list -p | grep java.home
```

 If it does not point to the SDK location or if it incorrectly references the JRE or an earlier version of the SDK, update it using `smreg(1M)` and restart the Sun (TM) Management Console using the `smcwebserver(1M)` command as follows:
 

```
# /usr/sbin/smreg add -p -c java.home=/usr/j2se
# /usr/sadm/bin/smcwebserver restart
```
- v 118N: Diagnostic Setup Pages are not internationalized. Text is displayed in English. Reference Bug Id: 5074536.
- v 118N: On the Topology page, the buttons and menu in the Interactive Applet view are not internationalized. They are displayed in English. Reference Bug Id: 4990031
- v 118N: Warning messages in Java Script application dialog boxes that are generated by diagnostic Setup Pages are not internationalized. Text is displayed in English. Reference Bug Id: 5074549

---

# Resolved Issues

The following table lists the issues that have been resolved with the product.

| Bug ID  | Brief Description                                                               |
|---------|---------------------------------------------------------------------------------|
| 4514574 | t3 state-status from unknown to ready-substituted should only be a warning.     |
| 4698376 | Help does not indicate that user names must start with a letter.                |
| 4702688 | Netscape 6.2.1 turn off frames, discovery of T3, log is displayed above header. |
| 4732156 | Storage needs to facilitate explorer-like output                                |
| 4761515 | References to non relevant device/host names in event grid                      |
| 4813741 | Make switch category a single category and let storage figure out what to run.  |
| 4819096 | generate a specific event for sense key code 0x4 with asc=ANY                   |
| 4836528 | With Netscape 7.0, right clicking on devices in topology is missing functions   |
| 4847616 | need a start-all and stop-all in start/stop devices                             |
| 4873997 | don't change the status of KILLED to DONE in volveverify only go to start or %  |
| 4879973 | Monitor topology zone filter should display only assigned ports and ISL ports   |
| 4891628 | topology grouping > unable to release device from group                         |
| 4907831 | I18N: using "am" and "pm" for the time format causes i18n support problems      |
| 4936163 | Master host shows up under slave(s) table.                                      |
| 4947104 | RFE: Add favorite icon for browsers                                             |
| 4948048 | Diagnose->Utilities: Go button is unnecessary                                   |
| 4953214 | RFE: Notification Provider setup difficult to navigate                          |
| 4953285 | RFE: Notify user of stale topology                                              |
| 4956090 | StorADE should take advantage of the ESM data host agent                        |
| 4958666 | HELP: Move or Remove 'Notification->Local Email->Clear Maximums' button         |

| <b>Bug ID</b> | <b>Brief Description</b>                                                         |
|---------------|----------------------------------------------------------------------------------|
| 4959839       | the snmp trap provider does not include a selection for Actionable only          |
| 4963152       | se2_configcheck on depkg, test mgr does not receive verbose output               |
| 4964555       | RFE: Topic field in advisor is vague                                             |
| 4970579       | hostIpno in Master rasagent.conf not always populated after ras_install on slave |
| 4971361       | diagnose->test from list should be an action table                               |
| 4975777       | some reports do not consistently show devices included in rasagent.conf          |
| 4975894       | UIRB: Table buttons not HCI 2.0 compliant                                        |
| 4976876       | Files are created that are world writable                                        |
