GDB 5.6 QUICK REFERENCE HP WDB Version 5.6 for HP-UX ( <u>http://www.hp.com/go/wdb/</u> )		break… if <i>expr</i> cond <i>n</i> [expr]	break conditionally on nonzero <i>expr</i> new conditional expression on breakpoint <i>n</i> ;	return [ <i>expr</i> ]	pop selected stack frame when executing [setting return value to expr]
Essential Commands	· · · · · · · · · · · · · · · · · · ·		make unconditional if no <i>expr</i>	signal s	resume execution with signal <b>s</b> (none if 0)
	debue seese [using sound.une soun]	tbreak	temporary break; disable when reached	go [line/*address]	set \$pc to a location and stop with a
	debug program [using coredump core]	rbreak <i>regex</i>	break on all functions matching regex		temporary breakpoint
	set breakpoint at function [in file]	watch <i>expr</i>	set a watchpoint for expression expr.Use	set var= <i>expr</i>	evaluate expr without displaying it. Use for
	start your program [with arglist]		*(ptr_type) address literal for hardware		altering program variables
	display program stack (backtrace)		watchpoint	Display	
	display the value of an expression	catch event	break at <i>event</i> , which may be catch, throw,		
	continue running your program		exec, fork, vfork, load, or unload.	[p / print] [ <i>/f</i> ][ <i>expr</i> ]	show value of <i>expr</i> [or last value \$] according
[n / s]	next line, or step over into function calls	info break	show defined breakpoints	v [Alvel even	to format, see <b>help p</b> .
Starting GDB		info watch	show defined watchpoints	x [/Nuf] expr	examine memory at address <i>expr</i> ; see <b>help x</b> .
gdb	start GDB, with no debugging files	clear [file:] [fun/line]	delete breakpoints at the beginning of <i>func</i> [in <i>file</i> ] or on a specific source <i>line</i> [in <i>file</i> ]	disassem [addr1 addr2]	display memory as machine instructions
gdb program [core]	debug program [using coredump core]	clear	delete all breakpoints at the current line	Threads	
gdb program <i>pid</i>	debug existing applications with pid pid			info threads [ <i>n</i> ]	display information on current threads [or a
gdbhelp	describe command line options	delete [ <i>n</i> ]	delete breakpoints [or breakpoint n]		specific thread n]
gdb -crashdebug	invokes GDB before program aborts	disable [n] or enable [n]	disable/ enable breakpoints [or breakpoint n]	thread <i>n</i>	switch to the context of thread n
• •	invokes OBB belere program aberts	enable once [n]	enable breakpoints [or breakpoint <i>n</i> ]; disable	thread disable [ <i>n</i>   <i>all</i> ]	disable thread with thread <i>n</i> or all
Stopping GDB		anable del (m)	again when reached	thread enable [n   all]	enable thread with thread n or all
[quit / exit]	quit GDB; also q or EOF (eg Ctrl-d)	enable del [n]	enable breakpoints [or breakpoint n]; delete when reached	set thread-check {[on/off]	enable detection for the following advanced
INTERRUPT	(eg Ctrl-c) terminate current command, or	ignore n count	ignore breakpoint n, count times	[option] [on/off]  [option] [num]	debugging options
	send to running process	command-list	execute GDB command-list	[recursive-relock] [on/off]	thread attempts to acquire a non-recursive
Getting Help		command-list n [silent]	execute GDB command-list every time		mutex that it currently holds
help	list classes of commands	command-not in [Shent]	breakpoint n is reached. [silent suppresses	[unlock-not-own] [on/off]	thread attempts to unlock an un-acquired mutex/ read-write lock
help <i>class</i>	short descriptions for commands in class		default display]	[mixed-sched-policy] [on/off]	thread waits on a mutex/read-write lock, held
help command	describe command	watch_target target_expr	watch a target location		by a thread with a different scheduling policy
help java	list Java and JVM debugging commands	end	end of command-list	[cv-multiple-mxs ][on/off]	different threads non-concurrently wait on the
java	list Java subcommands	Program Stack			same condition variable with different associated mutexes
Executing your Program		info module	identify load modules	[cv-wait-no-mx] [on/off]	associated mutex of a condition variable is
run [ <i>arglist</i> ]	start your program with arglist or with current	backtrace [n] or bt [n]	print trace of all frames in stack; or of <i>n</i> frames or where [n] innermost if <i>n</i> >0, outermost if <i>n</i> <0	[e. martine mail feasen]	locked and thread calls the pthread_cond_wait() routine
man duly and	argument list if arglist is not specified	from a [n]	• •	[thread-exit-own-mutex] [on/off	thread terminates execution without unlocking
run… < <i>inf</i> >outf	start your program with input, output redirected	frame [n]	select frame number n or frame at address n; if no n, display current frame		the associated mutexes/read-write locks
kill	kill running program	[up / down] n	select frame <i>n</i> frames up or down	[thread-exit-no-join-detach]	thread has terminated execution without
tty dev	use <i>dev</i> as stdin and stdout for next run	info frame [addr]	describe selected frame, or frame at <i>addr</i>	[on/off]	joining or detaching the thread
set args [arglist ]	specify arglist or empty list for next run		arguments of selected frame	[stack-util] [num]	the thread uses more than the specified % of
show args	display argument list	info args	local variables of selected frame	· · · · · · · · · · · · · · · · · · ·	the stack allocated to the thread
show envvars	show all environment variables	info locals		[num-waiters] [num]	the number of threads waiting on a pthread object exceeds [num]
show env var	show value of environment variable var	info [reg /all_reg] [ <i>rn</i> ]	register values [for regs rn or all registers] in the selected frame. Option all_reg includes	info [mutex]condvar[rwlock] [n]	lists all known mutexes, conditional variables
set env var string	set environment variable var to string		information for floating point registers too		or read write locks
unset env var	remove var from environment	Execution Control	······································	Expressions	
Shell Commands		continue[count] or c [count]	continue running; if count specified, ignore	expr	an expression in C, C++, or Modula-2
cd dir, pwd, and make	supported shell commands in gdb	continue[cound of c [cound	this breakpoint next count times	exp.	(including function calls)
shell cmd	execute arbitrary shell command string	step [count] or s [count]	execute until another line reached; repeat	addr@ <i>len</i>	an array of <i>len</i> elements beginning at <i>addr</i>
Breakpoints and Watchpoints			count times if specified	'file':: <i>nm</i>	a variable or function <i>nm</i> defined in file
		stepi [count] or si [count]	step by machine instructions source lines	{type} <i>addr</i>	read memory at <i>addr</i> as specified type
break [file:]line or b [file:]line	set breakpoint at <i>line</i> number	next [count] or n [count]	execute next line, including any function calls		expression used in most recent command
	[in file] e.g.: break main.c:37		• •	\$	•
break [file:]func	set breakpoint at func [in file]	nexti [count] or ni [count]	next machine instruction rather than source	\$n	nth displayed value
break [+/-]offset	set break at offset lines from current stop		line	\$\$	displayed value previous to \$
break *addr	set breakpoint at address <i>addr</i>	until [location]	run until next instruction (or location)	\$\$n	nth displayed value back from \$
break	set breakpoint at next instruction	finish	run until selected stack frame returns	\$var	convenience variable; assign any value
				show values [ <i>n</i> ]	show last 10 values [or surrounding \$n]

show conv	display all convenience variables	h size	size number of commands kept in history	
Symbol Table		h save [off/on]	save /do not save command history in external file	
Symbol Table info address s show where symbol s is stored		print[options] or p[options]	groups with the following options:	
info [func/var] [regex]	show names, types of defined functions or types of global variables (all,	p address [on/off] p array [on/off] p demangle [on/off]	print memory addresses in stacks, values compact or attractive format for arrays source (demangled) or internal form forr C++	
info var [regex]	or matching regex) show names, types of global variables (all, or matching regex)	p demangie [on/off]	source (demangied) or internal form for C++ symbols demangle C++ symbols in machine- instruction output number of array elements to display	
[whatis / ptype] [expr]	show data type of expr [or \$] without evaluating; ptype gives more detail	p elements <i>limit</i>		
ptype type			print C++ derived types for objects	
which symbol	prints the scope, file and line details of <b>symbol</b>	p pretty [on/off]	struct display: compact or indented	
GDB Input Scripts		p union [on/off]	display of union members	
ODB input Scripts		p vtbl [on/off]	display of C++ virtual function tables	
source script	read, execute GDB commands from script	show commands [n/+]	show last 10 commands, show 10 commands around number [n], show next 10	
define [cmd ]	create new GDB command cmd;			
[commandlist]	script defined by command-list		commands [+]	
end	end of command-list	Runtime Heap Checking		
document cmd help-text	create online documentation for new GDB	info corruption	detect memory corruption	
end	command <i>cmd</i> end of help-text	heap-check [option] [on/off]	set heap checking options	
		info leaks [leaks.out]	produce a memory leak report	
Signals		info heap [ <i>heap.out</i> ]	produce a heap allocations report	
handle signal <args></args>	specify GDB actions for signal:	info heap-interval < <i>filename</i> >	create heap growth report	
print or noprint	announce signal or be silent for signal	info heap process	high level memory usage of a process	
stop or nostop	halt / do not halt execution on signal	info heap arena	high level memory usage for all arenas	
pass or nopass	pass/ no pass of signals to program	info heap arena [0  1 2 ]	block level and overall memory usage with	
info signals	show table of signals and GDB action	blocks stacks	stack trace where applicable.	
Debugging Targets		set heap-check interval <nn></nn>	set incremental heap profiling	
target type param	connect to target machine, process, or file	set heap-check repeat < <i>nn</i> >	set repeat cycles for incremental heap profile	
help target	display available targets	set heap-check reset	reset incremental heap growth data	
attach param	connect to another process	Working Files		
detach	release target from GDB control	file [ <i>file</i> ]	use file for both symbols and executable	
set mapshared [on/off]	set the shared library loading mode in GDB	exec [file]	use file as executable only; or discard	
Controlling GDB		symbol [file ]	use symbol table from <i>file</i> ; or discard	
-		load file	dynamically link file and add its symbols	
set param <i>value</i> show param	set one of GDB's internal parameters display current setting of parameters	add-sym file addr	read additional symbols from file,	
	understood by set and show		dynamically loaded at addr	
complaint limit	number of messages on unusual symbols	info files	display working files and targets in use	
confirm [ <i>on/off</i> ]	enable or disable cautionary queries	path <i>dirs</i>	add dirs to search path for executable or	
editing [ <i>on/off</i> ]	control readline command-line editing		symbol files	
height lpp	number of lines before pause in display	show paths	display executable and symbol file path	
language lang	language for GDB expressions	info share	lists names of shared libraries currently	
listsize n	number of lines shown by list	Com file Comment	loaded	
prompt s <i>tr</i>	use str as GDB prompt	Core file Commands		
radix base	octal, decimal, or hex number representation	core-file FILE	FILE as core dump to examine memory	
verbose [on/off] control messages when loading symbols			registers	
width cpl	number of characters before line folded	packcore	create tar file for executable and core file	
	] groups with the following options:	unpackcore	unpack tar file created with packcore	
h exp [off/on]	disable/enable readline history expansion	getcore	examine core file	
and an end and a second s		dumpcore	generate a core file without modifying the	

set inline debug [options]	set inline debugging preferences				
[on]	set inline debugging without the breakpoints				
	feature				
[off]	disable inline debugging				
[inline_bp_all]	enables inline debugging with the breakpoints feature for all instances of an inline function enables inline debugging with breakpoints feature for individual instances of an inline function				
[inline_bp_individual]					
Source Files					
dir names	add directory names to front of source path				
dir	clear source path				
show dir	show current source path				
list [-]	show next ten lines of source or previous [-] ten lines				
list <i>lines</i>	display source surrounding lines, specified as:				
[file:]num	line number [in named file]				
[file:]function	beginning of function [in named file]				
[+off -off]	lines after or previous last printed				
*address	line containing address				
list f,l	from line f to line l				
info line <i>num</i>	show starting, ending addresses of compiled code for source line <i>num</i>				
info source or info sources	list the current source file or all source files in use				
forw regex or rev regex	search following or preceding source lines for regex.				
GDB under GNU Emacs					
M-x gdb	run GDB under Emacs				
Ctrl-h m	describe GDB mode				
M-s or M-n or M-i	to step one line (step), next line (next), or step one instruction (stepi)				
Ctrl-c Ctrl-f	finish current stack frame (finish)				
M-c	continue (cont)				
M-u or M-d	move up or down arg frames				
Ctrl-x &	copy number from point, insert at end				
Ctrl-x SPC	(in source file) set break at point				
GNU GDB Logging Commands					
set logging file	set the current log file				
set logging [on off]	set logging on or off				
set logging overwrite [on log]					
set logging redirect [on off] GDB License	set logging output mode				
show copying	display GNU General Public License				
show warranty	display full no warranty statement.
